Wind Rose and Graphics

In printing the Wind Rose Plot, I selected the cross-hatch fills. However, in the printout all the fills were solid black. When I selected the color fills, it worked well, printing shades of gray. What is the problem?

This problem is due to your computer's printer driver. When you press Print in WRPLOT View, the program sends a message to the Printer Driver, which then sends a message to the Printer. When you select the color fills, the printer driver tells the printer to print shades of gray. When you select the cross-hatching, the printer driver tells the printer to print cross-hatching. Some printer drivers don't know how to make the printer do this and the printer therefore simply prints solid black. You can solve this problem by trying a different printer driver.
